Open Question

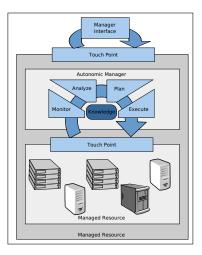

How to achieve Self-Management?

The Problem Autonomic Computing The Goal

The Autonomic Computing Architecture

- Managed Resource
- Touchpoint (Sensors & Actuators)
- Autonomic Manager
 - Monitor
 - Analyze
 - Plan
 - Execute
- Knowledge Source
- Communication
- Manager Interface

Introduction

Niche Platform Robust Management Elements Future Work The Problem Autonomic Computing The Goal

The Goal

Large-scale distributed systems

- Complex and require self-management
- May run on unreliable resources
- Major sources of complexity:
 - Scale (resources, events, users, ...)
 - Dynamism (resource churn, load changes, ...)

Goal

- A platform (concepts, abstractions, algorithms...) that facilitates development of self-managing applications in large-scale and/or dynamic distributed environment.
- A methodology that help us to achieve self-management.

Research Plan

Self-Management in large-scale distributed systems. Consists of four main parts:

- Part 1: Touchpoints and feedback loops in distributed systems
- Part 2: Robust Management
- Part 3: Improve management logic
- Part 4: Integrate previous parts in a self-managing system.

Self-Management for Large Scale Distributed Systems (A. Al-Shishtawy)

Niche Overview Management Part Runtime Environment

Niche

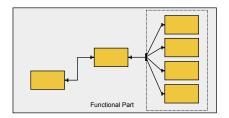

- Niche is a Distributed Component Management System
- Niche implements the Autonomic Computing Architecture for large-scale distributed environment
- Niche leverages Structured Overlay Networks for communication and for provisioning of basic services (DHT, Publish/Subscribe, Groups, etc.)

Niche Overview Management Part Runtime Environment

Management Part

- Management Elements
 - Watchers
 - Aggregators
 - Managers
 - Executors
- Communicate through events
- Publish/Subscribe
- Autonomic Managers (control loops) built as network of MEs
- Sensors and Actuators for components and groups
- Actuation API

Robust Management Elements

A Robust Management Element (RME):

- is replicated to ensure fault-tolerance
- tolerates continuous churn by automatically restoring failed replicas on other nodes
- maintains its state consistent among replicas
- provides its service with minimal disruption in spite of resource churn (high availability)
- is location transparent, i.e., RME clients communicate with it regardless of current location of its replicas
